CATCHMENT AREA TREATMENT PLAN
OF
UHL HYDRO ELECTRIC PROJECT
(STAGE III)

JOGINDER NAGAR DISTT. MANDI
(H.P.)

PREFACE

The Catchment Area Treatment Plan for UHL-III Hydro Electric Project has been prepared through the forest field staff of Jogindernagar Forest Division in active collaboration with the UHL Construction Division, HPSEB, Jogindernagar authorities.The document was actively revised,scrutinised and typed in the Environment cell, HPSEB, Shimla. The catchment area, falling in Ner, Jeetpur, Bhangal and Jagatpur Paraganas of Jogindernagar tehsil and Gunehar Paragana of tehsil Baijnath was traversed exhaustively both by the Forest and HPSEB staff and a pragmatic scheme was evolved encompassing afforestation measures, soil and water conservation (inclusive of engineering measures) and forest protection.Subsidiary silvicultural operations was also given primacy as also fire protection. The works suggested would contribute very positively for ushering in a stable healthy environment. Special mention is made of Sh. Ravinder Kumar Sharma , a Deputy Ranger in the office of Divisional Forest Officer Jogindernagar whose contribution to make the project a success was invaluable.

CONTENTS

C H A P T E R - I

1.1 GENERAL DESCRIPTION:

Mandi District in Himachal Pradesh is naturally richly endowed and has an enchanting scenic beauty. Where there are picturesque snow clad peaks, there also exist thick natural forests with rivers Beas & Satluj meandering through the area. The tract ties between latitude of 31°-54' North & longitude of 76°-49' & 77°13' east.

The area is surrounded by Distt. Bilaspur & Shimla in the East, Kangra in the West, Kullu & Lahaul & Spiti in the North & Hamirpur Distt. in the South. Where Mandi is a district, Jogindernagar is a sub-divisional headquarters.

Uhl River, located in Jogindernagar, is one of the major tributaries of Beas River and has a picturesque valley.

1.2 PROJECT AREA :

Three large Hydroelectric Projects stand executed/ proposed on Uhl River. Uhl Hydro Stage-I i.e. Shanan Power House, (Jogindernagar), 110 M.W. capacity has been commissioned during 1932. Uhl Hydel Stage-II i.e. Bassi Powerl louse, (Joginder Nagar), 60 M.W. Capacity has also been commissioned in 1970. Uhl Hydel Stage-III, Chulla Power House, 100 M.W. capacity is in its early/initial construction stage and awaits the necessary clearances from the Environmental/Forest wings of the Ministry of Environment and Forests, N.Delhi. Uhl Hydel Project Stage-III envisages the utilization of tail water of Bassi PowerHouse and water from Neri and Rana Khads. It is a down-stream development of the first two stages of the Projects i.e. Shanan (110 MW) and Bassi (60 MW).

The entire catchment of Uhl River is mountainous. Uhl and Lambadug Rivers, which meet near village Barot, are the main source of water for Uhl Projects Stage-I, II & III. Lambadug, which is a tributary of River Uhl, joins the latter at Barot village, in Himachal Pradesh, near longitude 76°-51' E & latitude 32°-2' N. The catchments of both Neri and Rana Khad are mountainous. The

prominent Khuds joining Rana Khad are Bajgar Khad, Sukkar Khad and Gugli Khad.

1.3 NEED FOR TREATMENT OF CATCHMENT :

Multi purpose Hydro Electrical Projects continue to be emphasised in the development planning of the State. Though assured water supply & electric power generation are the twin objectives, the projects planned do bring in their wake problems of environment and degradation, thereby negating many of the benefits, which accrue from commissioning of such projects.

Though the catchment area of Uhl River is about 384 Sq. Kms., it need not be treated as silt free water shall be available from Bassi Power House tailrace. Only the catchment areas of Rana Khad and Neri Khar which is about 98.90 Sq. Kms + 16.00 Sq. Km.= 114.90 Sq. Kms is required to be treated. Soil erosion in the catchment needs to be checked as otherwise the productivity of land would diminish & adverse affects would be there on the local water supplies. Increased aridity, increased incidence of land slides/ slips would pose problems increasing the siltation rate and reducing the reservoir life.

Any degradation in the catchment area would adversely effect the prosperity of the local people. There is need to check indiscriminate grazing in the catchment area which is another important feature responsible for degradation. Land degradation can be seen in the lack of proper vegetal cover. Land degradation reduces life and efficiency of impounded reservoirs. The various types of erosions are: -

(i) Splash erosion (ii) Sheet Erosion (iii) Rill Erosion (iv) Gully Erosion & (v) Channel Erosion.

(i) SPLASH EROSION: When the vegetative cover has been stripped away, the rain drops impact on soil is harsh. This results in topsoil being displaced thereby destroying soil structure.

(ii) SHEET EROSION: Loose soil is detached and transported by flowing water. This again causes lack of vegetal cover.

(iii) RILL, GULLY AND CHANNEL EROSIONS result depending on the velocity of water and lack of vegetation cover and subsequent cause loosening of the soil. Among the major drawbacks of soil erosion are:-

-Loss of production potential and loss of nutrients.

-Reduced infiltration rates and water flowing capacities.

-Increase tillage operations cost.

-Reduced water supply, decrease in the storage capacity and depletion of bio-diversity.

The treatment plan aims to increase the life of the reservoir by maintaining a low level of inflow of sediments into the reservoir. In order to achieve this, the soil would be protected right in the catchment through effective afforestation and various soil conservation measures both vegetative and engineering i.e. gully plugging, check dams etc. The so called developmental activities like construction of paths & roads, buildings etc. do destabilize the geology which results in heavy debris flow with rivers/khads. This requires proper controls and checks. Barot & its neighboring area feature very prominently on the tourist map of the State. Any improvement of the catchment would augment the natural beauty & wild flora and fauna potential of the area.

A comprehensive soil & water conservation strategy is envisaged. This is proposed to be done at a probable cost of Rs. 8,02,37,000 . Inclusive of afforestation, subsidiary silvicultural operations and forest development/protection the total cost would be Rs. 9,80,00,000/-. Provide for contingency(agriculture input, fuel-wood supply etc.) which is tentatively kept at Rs. 20,00,000/-. The total cost of the CAT Plan would thus be Rs. 10 crores flat.

1.4 UHL HYDRO ELECTRIC PROJECT STAGE-III :

1.4.1 GENERAL DESCRIPTION

Himachal Pradesh, blessed with immense hydel power potential and various other advantages, offers an attractive economic package for the entrepreneur. The run of the river type hydroelectric projects provides the best alternative for meeting future energy requirements.

Uhl hydel project stage-III, 100 M.W. capacity, envisages the utilization of the tail water from Bassi PowerHouse, which is being released into Neri Khad, which joins Rana Khad near Machhial Village & subsequently joins River Beas. To utilize the gross head available from Bassi tailrace to River Beas near village Chullah for power generation, during the year 1979-80, HPSEB took up investigations for its development. A detailed project report with proposal envisaged picking up the tail water from Bassi power house and

conveying the same through power channels (open and box sections) and also aqueducts over Laban Khad and Rana Khad and also utilizing the flow of Rana Khad through head race tunnel to the power house located near Chulla. With an initial installed capacity of 70 MW, the project was got techno-economically cleared from CEA Govt. of India during July, 1987 by HPSEB. The H.P Govt. signed a memorandum of understanding with M/s Ballarpur Indust. Ltd. (BILT) on 10/02/1992 for investigation and preparation of DPR of this Uhl Stage-III project. The firm prepared a DPR for 100 MW. Capacity but failed to get the same cleared from CEA. Consequently HP Govt. cancelled the MOU with BILT during 3/99. HP Govt. further decided to prepare a detailed Project report of Uhl Stage-III HEP (100 MW). In the instant proposal, water from Neri Khad and Rana Khad is also proposed to be added to the water picked up from Bassi tail race with a resultant gross head of 307.93 meters, thus resulting in an installed capacity of 100 MW. To meet up the peak load demand, 3.75 hours storage for Rana Khad and Neri Khad water i.e. 1,76,000 cum capacity of storage reservoir has been provided. The power plant is proposed to be operated as a peaking station in tandem with Uhl Stage-I & II except that it can be operated at part generating capacity by Rana & Neri khad's water.

The assessment of sediment load is not required on the discharge site as this a run of the river project proposed with trench weir and with no storage. The question of sedimentation does not arise as the boulders and other coarser sediment would pass over the trench weir while the sediment of size .2 mm and above will settle in the desilting tank from where the same can be flushed out. The silt load is bound to remain within natural limits and would have no adverse consequence on the project.

W A T E R - S H E D M A N A G E M E N T :

Under water shed management four headings are involved:

- Forestry.
- Soil sciences.
- Engineering.
- Agronomy.

Optimal use is involved of soil and water resources within a given geographical area. Changes come about in land-use & vegetative cover. For rainfall what is required as objectives, for an ideal watershed are:-

- Increased infiltration into soil.
- Control of excess runoff.
-

Engineering measures are necessitated for erosion control in agricultural land i. e. :-

- Contour cultivation.
- Contour bunding.
- Graded bunding.
- Vegetative waterways.

Contour Cultivation:

Under this cultivation is done across the slope. A multitude of mini barriers are created across the run-off flow which increases the detention storage in situ. The erosive potential of rainfall is thus decreased/reduced as infiltration into the soil increases. The effectiveness of contour planting and tillage in erosion control varies with slope, crop cover and soil. Contour cultivation remains most effective on moderate slopes of 2 to 7%.

Bunds along contours are contour bunds and when constructed with some slope are called graded bunds. Contour bunding is useful for permeable soil and do not suit soil with poor internal drainage. Spacing of bunds should be such as to intercept the erosive velocity. Earthern, masonary and stone weirs are constructed depending on need. Where rainfall is high, graded bunds are favoured.

Grassed waterways are outlets for channel type of terraces to convey the collected or surface water causing safety into natural drainage courses without gully erosion. For erosion control measures, for non-agricultural lands, the following measures are resorted to:-

- Afforestation.
- Gully control.

  Pasture development.

Salient Features:-

LOCATION	
STATE	HIMACHAL PRADESH
DISTRICT	MANDI
RIVER	Uhl river tail water of stage-II, Neri Khad and Rana Khad in Beas basin.
LOCATION	Diversion sites near Bassi Powerhouse (Uhl-Stage-II), Neri Khad (EL.-894.50 m), Rana Khad (EL.-897. 55) & powerhouse near village a Chullah.

HYDROLOGY	
i. River	Uhl.
Catchment area at Barot new intake site.	370 Km^2
Maximum observed average 10 daily discharge at new intake site.	327.66 m^3/ Sec.
Firm discharge for 90% availability.	5.50 m^3/ Sec.
Firm discharge for 50% availability.	15.00 m^3/ Sec.
Availability corresponding to design discharge of 25.91 cumecs.	37.50%
ii) Rana Khad	
Catchment area at Bagla site.	98.90Km^2.
Maximum observed av. 10 daily. Discharge at Bagla.	53.39 m^3/ Sec.
Firm discharge for 90% availability.	2.20 m^3/ Sec.
Firm discharge for 50% availability	4.00 m^3/ Sec.
Availability corresponding to design discharge of 14.30 cumecs.	11.75 %
ii) Neri Khad	
Catchment area at Shanan site.	16 Km^2.
Maximum observed av. 10 daily. Discharge at Shanan.	0.83 m^3/ Sec.
Firm discharge for 90% availability.	0.23 m^3/ Sec.
Firm discharge for 50% availability	0.40 m^3/ Sec.
Availability corresponding to design discharge of 1.10 cumecs.	12.50 %

BASSI POWER HOUSE TO STORAGE RESERVOIR AT BAGLA

1.	**NERI KHAD DIVERSION WORKS**	
	Type	Trench weir.
	Design discharge i/c flushing discharge.	8.40 cumecs.
	Length.	15 m
	Width	1.75 m
	Crate level.	894.50 m
	Design flood discharge.	400 m^3 / sec.
2.	**HEAD REGULATOR**	
	Design discharge.	6.75 cumecs
	Length	11.75 m
	Size	2 mx2.85 m
3.	**DESILTING ARRANGEMENTS**	
	Type	Surface.
	Size	2 Nos. chamber (45mX 12mX 2.82m)
	Transition length	22.50 m each.
	Particle size to be removed.	All particles down to 0.2 mm.
4.	**Bassi power House Tailrace.**	Junction diversion works.
	Type.	Rectangular with gate of hoist arrangement.
	Size.	4.70mX2.50m.
	Bed level	889.16m
	Spillway	Gated baffle type.
	Type	7.00m X 2.50 m.
	Size	889.75 m
	Crest El.	
5.	**Power channel upto reservoir RCC Box.**	
	Type.	Rectangular.
	Size	3.60x5.75 m.
	Length	1250 m
	Discharge carrying capacity	27m^3/sec.
	Bed slope	1.2500
6.	**Laban Khad Aqueduct:**	
	Nature	Depressed aqueduct.
	Type	Circular steel pipe ASTM-A-516 (Grade-II)
	Diameter	1.90 m
	Length	81.0m

1. **RANA KHAD TO RESERVOIR:-**

Diversion Structure:-

Type	Trench weir
Design discharge i/c flushing discharge	22.16 cumecs
Length	27 m
Width	2.25 m
Crest El	897.65 m
Design flood discharge	1300 cumecs

2. **HEAD REGULAR :**

Designs discharge	17.87 cumecs.
Length.	17.50 m
Size.	3.50 m

3. **DESILTING ARRANGEMENT:**

Type	Surface.
Size.	4 Nos.chamber (75mx12mx3.75m (each)
Transition length.	30 m
Particle size to be removed.	All particle down to 0.20 mm.

4. **POWER CHANNEL :**

Type.	Cut and cover rectangular.
Size	2.10m x3.40 m.
Discharge carrying capacity.	14.30 m3/ Sec.
Length	1970 m.
Slope	1:370

5. **DIBNU NALLAH AQUEDUCT :**

Type.	RCC Box..
Size.	2.10 mx3.40 m

6. **STORAGE RESERVOIR At Khudar**

Type	Surface trapezoidal shape.
Live storage capacity.	1,76000 m3
F.R.L.	890.90 M
MDDL.	882.00 M
Peaking duration.	3.75 hour

7. **SPILLWAY:**

Type.	Chute.
Crest length	20 m
Crest El.	890.90 m
Discharge carrying capacity.	15.40 cumecs

8.	RANA KHAD AQUEDUCT:	
	Nature	Depressed aqueduct below scour duct
	Type	RCC duct
	Diameter	4.15 m
	Length	424 m
9.	HEAD RACETUNNEL:	
	Shape	Circular.
	Length.	8275 m
	Diameter	4.15 m
	Designs discharge	41.30 cumecs.
	Bed slope	1.570
10.	ADIT AT OUTLET	
	Shape	D shaped
	Diameter	4.15 m
	Length	120.00 cumecs
11.	INTERMEDIATE ADIT	
	Shape	D. shaped
	Diameter	4.15 m
	Length	970 m
12.	SURGE SHAFT:	
	Type and No.	Restricted orifice one open to sky.
	Diameter.	13 m and 9m (riser)
	Orifice diameter.	1.50 m
	Height	45.00 m and 12 m (riser)
	Top level.	905.00 m
	Bottom level	848.00 m
	Maximum up surge level.	903.50 m
	Minimum down surge level.	850.00 m
13.	PENSTOCK;	
	Type.	Circular steel lined.
		i) ASTM-A-516 grade 60 for 11.50 mm to 35.00 mm thickness.
		ii) ASTM-A-537 class-I for 30 mm to 35mm thickness.
		iii) ASTM-A-517 grade 26 mm

	Diameter.	Main (1 No.) 3.40 m Branches 2 Nos. 2.40 each.
	Length.	Main 1773m, after bifurcation 80 m.
	Discharge carrying capacity.	41.30 cumecs
14.	POWER HOUSE:	
	Type	Surface.
	Size.	36.80 m X 24.70 m.
	Type of turbine.	F. Francis vertical axis.
	Centre line of unit.	576.10 m
	Installed capacity.	100 MW
	Generating units.	2 Nos., 50MW each.
	Gross head	307.93 M
	Design head	282.90 m
	Tail race.	25.30m.
	Length	71 m
	MTWL	EL.580 m
15.	SWITCHYARD:	
	Size and type.	150m X 100 m
	No. of circuits.	One 132kV double circuit line, Chullah powerhouse to Hamirpur single 132 kV circuit line to Bassi powerhouse.
	Voltage.	132 kV.

UHL Const.Division,HPSEB,
Joginderngar, Mandi (HP).

C H A P T E R - I I

2. DESCRIPTION OF PROJECT AREA :

2.1 PROJECT LOCATION :

The Powerl louse site is located on the Right Bank of river Beas near village Chullah longitude 76°-43'-45" & latitude 31°-52'-30". The area falls in the catchment of Rana Khad. Diversion works from, Bassi Powerhouse and of Rana Khad & intake works of Project are 7 Kms. from Jogindernagar railway station. Power House site is approachable through Baijnath Kandapattan road & Jogindernagar Ladbharol road via Neri. Baijnath & Jogindernagar are connected through narrow gauge railway line of Northern Railway. The nearest broad gauge Railway station is Pathankot & it is 160 Kms. from Jogindernagar.

2.2 PROJECT AREA.

The total geographical area of the Rana Khad catchment is 98.90 Sq. kms. appx. while 16 Sqr.Kms. approx. is the area of Neri Khad. The priorities of treatment are to be based on different parameters & studies.

2.3 PHYSIOGRAPHY, RELIEF & DRAINAGE :

The area is entirely mountainous. The slopes are steep to precipitous. The significant Khads flowing into Rana Khad are Gugli Khad, Bajgar Khad & Sukkar Khad. All these Khads have origins at elevation from 1250 mt. to 3000 mt. & bed slopes generally range between 1:15 to 1:30.

2.4 GEOLOGY :

Project area falls in Mandi District of Himachal Pradesh covered by topo-sheets No. 53 A/9 and 53/A/13. The rock type encountered around the project site include sandstone, silt-stone, Clay (stones & shales), gneiss and boulder conglomerate. Due to differential weathering, the rock masses show well-marked topographic expression with bold projecting ridges of competent bands alternating with narrow furrows along weaker or incompetent members. High level gravel terraces occur on the banks of Neri Khad and Rana Khad, The Jogindernager thrust which crosses close to the Bassi Power House, is covered in the area between Ner Khad & Rana Khad, by an extensive

deposit of fluvio-glacial debris. No offsetting has been noticed in the fluvial-glacial material indicating that the Jogindernagar thrust may have been seismically inactive atleast since the sub-recent times.

The Palampur Thrust, which forms the faulted junction between the Dharamshala beds and the Shiwalik conglomerate, crosses the proposed penstock alignment. The thrust zone consisting of 40 to 50 m wide sheared crushed rock zone is trending inN-15° W-5.15° E direction and dipping 55° to 65° towards the easterly direction.

SEISMICITY:

This segment of the Himalaya where the project area lies is prone to severe earthquakes. The most severe amongst these has been the Kangra earthquake of 1905. The project site lies in zone V of the Indian seismic Zoning Map. Few earth quacks of magnitude greater than VI have occurred in the area.

CLIMATE:

As per classification based on climate, the year is divided into four seasons as under:

i.	Summer Season	April to June
ii.	Rainy Season	July to September
iii.	Autumn Season	October to November
iv.	Winter Season	December to March

Major portion of the tract enjoys a temperate climate while the lower zone is more sub-tropical. Variation in altitudes does effect the climatic pattern. 70% precipitation occurs during rainy season is 70% while the rest 30% falls during the winter season approximately. Most of the rain is received from southwest monsoon during rainy season. The high peaks experience heavy snowfall from December to March.

LAND USE PATTERN:

The land use pattern in the Rana Khad and Neri Khad catchment area is as under:

i.	Total geographical area	11490 Hec.
ii.	Reserve forest	NIL
iii.	Demarcated Protected forests	3419 Hec.

And other forest land.

v. Total forest area = 6441 ha.

Agriculture/Horticulture	+	Uncultivated
4179 Hec.	+	870

TOTAL PRIVATE LAND = 5049 Hec.

Above figures shows that area under forest cover is 56%.

2.8 **HYDRO-ELECTRIC POTENTIAL:**

Previously Uhl Hydel Project Stage-III (4x 17.5 M.W.) had been techno-economically cleared by the Govt. of India. With the capacity increasing from 70MW to 100 MW, due to availability of more hydrological data, the case is being taken up afresh for sanction.

2.9 **CROPPING PATTERN:**

The traditional Rabi and Kharif crops are cultivated i.e. Wheat during Rabi and Maize, Rice in Kharif season. The yield is as under:

CROP	YIELD PER HECT.
Maize	9 Qtls.
Rice	8 Qtls.
Wheat	9 Qtls.
Pulses	2 Qtls.

The landowners are marginal farmers practicing agriculture.

2.10 **LIVE STOCK:**

According to fresh cattle census during the position of live stock is as under:

CATTLE	SHEEP	GOATS	TOTAL
14766	3568	2963	21297

2.11 POPULATION :

According to fresh census during 12/93 human population in Project area is as under:

MALE & FEMALE – 29,652

The density of population is about 3 persons per hec. This is low due to the rugged & inaccessible terrain of the area having poor communication facilities. However, in contrast, the livestock population is nearly 0.7 times of human population. The project area comprises various villages/hamlets namely Neri, Khuddar, Kanduni, Kaunsal, Darat Bagla, Balh, Banoun, Chalarg, Changar, Bangotar, Raktal, Gulana, Sanhali and Chullah where the population is thin.

2.12 SOCIO-ECONOMIC STRUCTURE :

The population in the catchment area mainly depends on agriculture and animal husbandry such as rearing of sheep, goats. They also work as laborers with various Govt. agencies, even outside the district and State. Hence in the catchment area, at least one member of each family is employed in Govt./Semi-Govt. jobs. About 20% of the total population are below the poverty line while the remaining is quite well to do. There is an acute shortage of employment opportunities in this locality. The project when initiated would be able to fill this gap to a large extent.

C H A P T E R - I I I

3. PRESENT POSITION :

3.1 FOREST & FORESTRY IN THE PROJECT AREA:

Forests play a vital role in the life of the human beings. The important advantages of the forests are as under:

i. Provision of fuel, fodder & timber.

ii. Help maintain ecological balance.

iii. Provide raw material to various Industries and factories.

iv. Reduce soil and water erosion.

v. Increase crop production indirectly.

vi. Help in increasing the life span of the hydroelectric projects.

Based upon Champion and Seth's classification, the main forest type in the catchment area is Group 12 which is the Himalayan Moist Temperate Forest and the prominent sub group is 12/C1 which is the Lower Western Himalayan temperate forests. The grasslands are composed mostly of perennial mesophytic herbs and grasses. The main herbs are Primula, Anemone, Iris, Gentian, Meconopris, Aconite etc. The main grasses are Agropyron longlaristatum, Agropyron semicostatim, Branchypodium, sylvaticum, Bromus asper, Dactylis spp., Danthonia spp.

3.1.1 COMPOSITION AND CONDITION OF THE CROP:

In the project area mainly Ban, Rai, Chil, Rhododendron are found and also very few trees of Horse chestnut in the high ridges. Bushes like Berberis, Principia, Carissa, Rosa, Murraya and various grasses are found as ground cover.

3.1.2 FOREST MANAGEMENT:

Mainly all the waste land and degraded forest area in the catchment area are covered with Chil plantation which are coming up very well. However, there is pressure from people for rights of trees. Indiscriminate grazing does cause extensive damage to the vegetation.

3.1.3 MEDICINAL PLANT :

There are a large variety of Medicinal Plants i.e. Tej Patta, Diascorea, Nakh Nihani, Dhoop, Karoo etc. found growing in the catchment area.

3.2 WILD LIFE :

Animals found are Leopard, Fox, Barking Deer, Choral, Bear, Porcupine, Wild Bear, Leopard Cat, Jackal.

BIRDS :

Chakor, Partridge, Monal, Wild Cock, Koklash.

3.3 AGRICULTURE :

The land holdings are very less. People mainly grow wheat, paddy, maize, arbi, potato and rajmah in the higher altitudes.

3.3.1 LAND HOLDING:

Average land holding is less than 1 acre per family.

3.3.2 SOIL CLASSIFICATION:

Sandy loam is the main soil composition in the area.

3.3.3 LAND CAPABILITY CLASSIFICATION:

According to Soil Survey, the project area comprises of 20 sub-water sheds, which are detailed as under: -

SUB-WATER SHED NO.	INTENSITY OF SOIL EROSION
BP Ia	High
BP Ib	Medium
BP Ic	Medium
BP Id	High
BP Ie	Low
BP If	Low
BP Ig	Low
BP Ih	Medium
BP Ij	Medium
BP Ik	V-Low
BP Im	M
BP 2a	High
BP 2b	Low

BP 2c	Low
BP 2d	V-Low
BP 2e	V-Low
BP 2f	Low
BP 2g	V-Low
BP 2h	V-L
BP 2g	M

About 20% of the land is irrigated land.

CHAPTER - IV

4. PROBLEM ANALYSIS APPROACH AND STRATEGY

4.1 ENVIRONMENTAL PROBLEMS :

The project area forms a part of the Himalayas, which are the youngest, largest & highest mountain ranges in the world. The land is still in search of final form and soil erosion is one of the most serious problems in the areas. The Eco-system is thus most fragile. In this catchment, the main precipitation is in the form of rain during rainy season and in the winter season some snow is also received on the higher reaches. Irregular and unsystematic rainfall causes run-off in the form of floods, resulting in sheet and gully erosion, rill formation, bank erosion, slips and landslides. Hence project area suffers from the following major problems which add to soil erosion.

i. Natural ecological and climatic calamities due to heavy rainfall and land slides.

ii. Damage of prime land due to excessive grazing by increased live stock.

iii. Depletion of forests due to the removal of fuel, fodder and timber.

iv. Erosion hazards due to various developmental activities such as the construction of new roads, paths etc.

4.2 SEDIMENT LOAD:

4.2.1 INTENSITY OF SOIL EROSION :

The average annual run-off is 90% in a dependable year (3.07 X 10 ham) & 50% during a mean year (4.10 X 10 ham).

4.2.2 SEDIMENT CONCENTRATION :

It is high during the rainy season when heavy rainfall takes place.

4.3 SOIL EROSION TYPES :

Following types of soil erosion are prevalent in the catchment area.

4.3.1 SHEET EROSION: Steep to precipitous slopes as also the cultivated as well as forestland, suffer from sheet erosion during rainy season. Pastures suffer from moderate to very high erosion whereas areas covered with dense crop suffer from splash and laminar erosion. This area requires treatment to minimize splash and run-off on sloppy lands.

4.3.2 RILL EROSION: Run-off on account of rainfall collectively creates well-defined channels of enlarged width and depth (not exceeding 30-40 cm). This leads to gully formation.

4.3.3 GULLY EROSION: Many rills join together to form a gully in which water flows with higher speed and turbulence and is responsible for heavy sediment flow to river and streams causing floods.

4.3.4 STREAM AND RIVER BANK EROSION: A large number of nallahs, rivulets and streams in the catchment, carry sediment into the RÁNA KHAD, with frequent cutting of slopes, resulting in widening of the RANA KHAD and its tributaries and heavy soil erosion.

4.3.5 ROAD CONSTRUCTION EROSION: Roads and paths coming up in the catchment area are also causing land slips/slides resulting in silt problem in the RANA KHAD.

4.3.6 LAND SLIDE EROSION: Project area being clayey loam and sandy loam is quite prone to land-slides and land-slips that cause heavy toll in terms of tree growth, valuable fertile soil and also aggravate the silt problem in RANA KHAD and its tributaries.

4.4 LAND USE AND THEIR EROSIONAL BEHAVIOUR:

The water retention and infiltration behavior shows that there is practically a huge over-land water flow, from the Temperate Zone forests. Major soil erosion in the catchment area is due to heavy rainfall and run-off.

4.5 APPROACH AND STRATEGY:

A technologically sound, economically viable and socially acceptable comprehensive conservation strategy is to be evolved to retrieve the fast deteriorating ecology of the region. The main and immediate approach is to provide sediment free water as also its regular supply, which has direct impact on the successful running of a proposed hydroelectric project. For this purpose, a comprehensive plan aimed at the following objectives is to be evolved:

i. Construction of check walls, checks dams, water percolation tanks, farm ponds and crate-wire spurs to check the soil and water erosion effectively.

ii. Afforestation in degraded forest lands to meet the fuel, fodder

iii. Intensive Pasture management/ improvement in the catchment area to fulfil the requirement of the locality. Providing high quality pasturage to meet the needs of the live stock of the area. Checking the soil and water erosion directly, as well as boosting the economy of the area indirectly and ensuring proper hydrological functioning of the hill eco-system.

4.6 AGRICULTURE:

The watershed management and planning, envisages an integrated management of the land, water, plants and animal resources of the watershed. This is to be done on a sustainable basis to achieve optimum production without rendering any adverse and deteriorating impact on the resources and the ecological balance. Aim must be to ensure that the socio-economic condition of the people in the area is improved.

In the hilly portion of the proposed project area, cultivation is mostly practiced on un-terraced steep slopes, where irrigation is a serious problem. There is a limited land holding with the people, in the said area, due to which the land has to face extra pressure. It does not have time to get reclaimed, which in turn leads to soil erosion. Thus to check soil erosion, ensure water conservation and reclamation of the land levelling, terracing, re-modeling and providing of retaining walls/check walls is required. A small provision of contingency in the abstract of cost takes care of this. This would in turn ensure optimum production of agriculture produce.

The catchment area receives the maximum precipitation during the rainy season and less precipitation during winter season. Hence tapping the adjoining nallahs through flow irrigation channels can be beneficial during the lean period. The motivation of the local people to adapt to modern, improved and scientific methods of agriculture and for using modern agricultural implements and to abandon age old and unproductive methods need focussing.

4.7 ANIMAL HUSBANDRY:

The catchment area is thickly populated. The livelihood of people is dependant on farming and its live stock population is also very high. As per the latest cattle census, the total live stock population in the project area is 21,297. There

become susceptible to disease, which affect their production potential. In addition, the following; are the main problems being faced in the area:

i. People have very poor quality and low milk yielding cattle.

ii. Sheep and goats are of poor quality, which yield less, and poor quality wool.

iii. Due to shortage of fodder, stall-feeding is not possible which adversely affects cattle health, resulting in increasing number of stray animals.

4.8 HORTICULTURE:

Due to the various limitations and constraints observed in the area, horticulture activities are not visible in the catchment area, except for some small tea-gardens & house-hold kitchen activities.

4.8.1 PHYSIOGRAPHY:

The physiography of the hilly portion of the catchment area is tough and the gradient is steep to very steep. Though the plantations have been carried out in most of the area of the catchment, yet these are still in nascent form. Since the soil is sandy loam and sandy clay there are problems of landslides; landslips and soil erosion is very serious. Further extensive afforestation and plantation of fruit trees is to be carried out, after re-modeling and reclaiming the land properly.

4.9 FINANCIAL POSITION:

People of the catchment area are poor and need liberal financial help, directly and indirectly, in the shape of nursery plants. The insecticides, pesticides and fertilizers need to be provided at nominal rates.

4.10 PISCICULTURE:

There is a vast scope for development of fisheries in the reservoir lakes. It can be propagated in farm ponds after training of the local people. This too could be featured in the contingency.

C H A P T E R - V

5. OBJECTIVES, PROBLEMS AND COMPONENTS :

5.1 OBJECTIVES OF THE C.A.T PLAN:

Main objective of the C.A.T. plan is to maintain a regular sustainable supply of water to the Hydroelectric Power Project. Further the eco-system must be restored, improving the socio-economic status of the area and its people. Effective soil and water conservation measures need to be adopted as also afforestation & pasture improvement and modern scientific patterns of agriculture and horticulture. These objectives are categorized as under: -

5.2 PROTECTIVE OBJECTIVES :

i. To restore and maintain the ecological balance with integrated approach to ensure the longevity of the reservoir.

ii. Soil and moisture conservation in the catchment area by adopting proper conservation measures.

5.3 ECONOMIC AND PRODUCTIVE OBJECTIVES:

i. To increase the potential production without depleting the natural resources.

ii. To increase fuel, fodder and timber production in the area to meet with the day to day requirements of the local people thereby reducing the pressure on natural forests.

iii. To provide employment to the local people.

iv. To enrich the area with medicinal plants.

v. To increase the fauna by providing an adequate and desired eco-system and ensure protection against poachers.

5.4 SOCIAL OBJECTIVES:

i. Scientific management of the pastures is required to produce high quality fodder, ensuring good quality and high yield of wool, mutton and milk.

ii. Improvement is required in the breed of domestic animals.

5.5 PROJECT PERIOD AND PHASING:

The project will be executed in a total period of ten years. Following works will be carried out in different years.

1st YEAR (COMMENCEMENT YEAR OF THE CAT PLAN):

During the first year, enrichment planting (57 hectares) would be done as also subsidiary silvicultural operations i.e. climber cutting and removal of weeds. Protection measures like repair of boundary pillars, fire protection measures would also be done. Infra-structural works i.e. construction of forest paths, a forest hut etc. would also be taken up. Check Dams, check and retaining walls, farm ponds, spurs construction under soil conservation measures are of primacy to ensure that land slides do not occur and gully control is there.

IInd YEAR :During the second year, enrichment planting(103 hectares) as also first year maintenance of first year planting would be done as also subsidiary silvicultural operations i.e. climber cutting and removal of weeds. Protection measures like repair of boundary pillars, fire protection measures would also be done. Infra-structural works i.e. construction of forest paths, a forest hut etc. would also be taken up. Check Dams, check and retaining walls, gully plugging, farm ponds, spurs construction under soil conservation measures are of primacy to ensure that land slides do not occur and gully control is there.

IIIrd YEAR :During the third year, enrichment planting(105 hectares) would be done and maintenance of 1st year and 2nd year as also subsidiary silvicultural operations i.e. climber cutting and removal of weeds. Protection measures like repair of boundary pillars, fire protection measures would also be done. Infra-structural works i.e. construction of forest paths, a forest hut etc. would also be taken up. Check Dams, check and retaining walls, farm ponds, spurs construction under soil conservation measures are of primacy to ensure that land slides do not occur and gully control is there.

IVth YEAR : During the fourth year, enrichment planting(90 hectares) would be done and maintenance of 1st year/2nd year/3rd year as also subsidiary silvicultural operations i.e. climber cutting and removal of weeds. Protection measures like repair of boundary pillars, fire

construction of forest paths, a forest hut etc. would also be taken up. Check Dams, check and retaining walls, farm ponds, spurs construction under soil conservation measures are of primacy to ensure that land slides do not occur and gully control is there.

V YEAR TO XIIth YEAR :During the fifth year, enrichment planting (65 hectares) would be done and maintenance of 1st year/2nd year/3rd year/4th year while during the VIth and VIIth year, 60 hectares each, would be taken-up for enrichment planting and maintenance of previous years planting as also subsidiary silvicultural operations i.e. climber cutting and removal of weeds. Protection measures like repair of boundary pillars, fire protection measures would also be done. Infra-structural works i.e. construction of forest paths, a forest hut etc. would also be taken up. Check Dams, check and retaining walls, farm ponds, spurs construction under soil conservation measures are of primacy to ensure that land slides do not occur and gully control is there.

From 2009 till 2013 the stress would only be on maintenance and protection.

5.6 PROJECT PROPOSAL AND COMPONENTS:

The catchment area spreads from "GHOGHAR DHAR" and "SIKANDAR DHAR" to barrage axis. The proposal for afforestation and soil conservation, component-wise has been provided in Chapter-VI.

CHAPTER - VI

6. FORESTRY,SOIL AND WATER CONSERVATION:

61. STATEMENT OF THE AREAS TO BE PLANED IN THE CATCHMENT AND EXPENDITURE THEREOF:

Details of the area where afforestation /pasture developed is to be carried out is as under :

AFFORESTATION :

1.Sukar 1st	= 25 Hect.	16. Suhi	= 20 Hect.
2.Bhala Rinda	= 3 "	17. Bagra dhar 1st	= 10 "
3.Magru dhar	= 8 "	18. Bagra dhar 2nd	= 50 "
4.Ahju 1st	= 3"	19. Bagra dhar 3rd	= 10 "
5.OD 11 Marhola	= 50 "	20. Mihara dhar	= 40 "
6.ND 12 Marhola 1st	= 20 "	21. Dugha gahar 1st	= 40 "
7.ND 13 Marhola 2nd	= 35"	22. Dugha gahar 2nd	= 40 "
8.ND 14 Marhola 3rd	= 5 "	23. Karanpur dhar 1st	= 5"
9.Tramat	= 5 "	24. Galu	= 2 "
10.Bhadyara	= 2 "	25. Trimunda	= 15 "
11.Khalchi nal	= 5 "	26. Awaiyer	= 10 "
12.Khaprotu 1st	= 10 "	27.Siyuri C. III	= 25 "
13.Harabagh 1st	= 2 "	28. Banad	= 5"
14.Digli 1st	= 50 "	29. Reunti dhar	= 25"
15.Digli 2nd	= 10 "	30. Gugli Khad	= 10"

TOTAL 540 Hect.

The detailed costs are attached as Annexure-A,B,C and the maps are in Annexure D.The abstract of cost (Anexure A) is as under.

SR. NO.	ITEMS OF WORK	EXPENDITURE(Rs.)
01.	Plantation (Afforestation)	1,14,55,800
02.	Subsidiary Silvicultural Opearations	16,51,290
03.	Consolidation & Demarcation	30,502
04.	Forest Protection	1,55,000
05.	Construction of roads	19,70,000
06.	Construction of buildings	25,00,000
07.	Soil Conservation works	8,02,37,000
	Total	Rs. 9,79,99,592/-
08.	Contingency(Agriculture improvement support,Fishery propogation,fuel-wood supply and other JFPM activation)	20,00,000/-
	Grand Total :	Rs. 9,99,99,592/-
	OR Say -	Rs. 10 crores flat

6.2 EXPENDITURE FOR OTHER MEASURES IN THE CATCHMENT AREA :

The detailed estimates of engineering structures to be provided at various places in the catchment area are enclosed as Annexure-C.

6.3 SOIL CONSERVATION MEASURES :

It is proposed to adopt various soil conservation measures to prevent soil erosion in nallahs, riverbanks, and landslide areas. This is briefed as under: -

6.3.1 STABILIZATION OF LAND SLIDE/SLIPS :

This type of the area in the catchment requires the following type of control measures depending on the site. .

i. Construction of dry masonry/cement mortar check walls, checks dams, Retaining walls, spurs , farm ponds and silt detention dams.

ii. Afforestation.

6.3.2 TREATMENT OF FLOOD PRONE NALLAHS.

Nallahs are required to be treated by stabilization of the banks by providing spurs and constructing check dams, check walls, retaining walls and brush wood check dams to check and regulate the flow of water.

6.3.3. RIVER/NALLAH STABLIZATION :

To control the bank erosion of Mandokhar Nalla, Dul Khad, Bagra Khad, Bajgar Khad, Nihru Nalla various bank erosion measures at prone points are required.

6.3.4 ROAD STABLIZATION:

At present there are the Ahju Basahi and Zimzima, Dul-Banad-Chauntra roads which are under construction as well as the widening of Pathankot-Chakki-Mandi Road (N.H.20) which is in progress in the catchment area. Construction of retaining walls, breast walls and other engineering structures along the roads under construction are required to be taken-up/constructed by the P.W.D. authorities to check soil and water erosion as well as to ensure longevity of the reservoir.

CHAPTER - VII

7. AGRICULTURE:

The problem being faced in the agriculture sector has been discussed in detail in Chapter-IV. Keeping in view the problem, the following proposals are suggested:-

7.1. **PROPOSED TREATMENT PROGRAMME** : A provision has been made in the total cost of the project under contingency which provides for Rs.20,00,000/- which would be used by the Project authorities in collaboration with the Forest and Agriculture Departments after effective liaison with the people under Joint Forest Participatory programme. Support for improved agriculture practices, provision of high quality seed and other agriculture inputs as also fishery improvement etc. can be done through it.

7.1.1. **SOIL AND WATER CONSERVATION** :

The total cultivated area of the catchment is 3129 hec. Cultivation is mostly practiced on the outwardly sloping terraced land. Effective irrigation of the entire cultivated land is not possible under this circumstance. Land levelling and treatment/reclamation of land is required for which the Department of Agriculture should take effective measures.

7.1.2 **LAND LEVELLING AND TERACING** :

In view of the latest instruction from Govt. of India, neither the Hydel Project can afford levelling and terracing for making culturable land of general public productive nor funds are available due to the poor economic condition of the country.

7.1.3. **TREATMENT OF CULTURABLE WASTE LAND:**

There is 2964 hec. of reclaimable wasteland in the catchment proposed. The farmers are mostly marginal farmers and their average holding is less then one hect. per family. Although more land is required for agriculture, it is not possible for

electric power generation project to meet the expenditure on such reclamation.

7.1.4 TREATMENT OF EXISTING KUHLS :

In order to made available water for irrigation of agriculture fields existing kuhls need to be repaired by the I & PH Department. The project authorities will draw attention of the I & PH department to this aspect.

CHAPTER- VIII

FUELWOOD DEPOTS FOR PROJECT LABOUR AND EMPLOYEES OF UHL STAGE-III, HYDRO-ELECTRIC PROJECT :

It is estimated that the skilled and semi-skilled and unskilled labor will be deployed to complete the project within the estimated period. Majority of the labor force will be imported from the outside of the project area. It is proposed to provide fuel and kerosene from depots by the project authorities, so that labor may not indulge in illicit felling and removal of fuel-wood and timber from the adjoining Govt. forests. Fuel-wood depot will be opened by the project authorities and the regular supply will be made through Himachal Pradesh State Forest Corporation. Kerosene oil and cooking gas will be arranged from the concerned agencies.

It is also proposed to provide community canteen facility to the labour. Per capita requirement of fuel-wood per year is estimated as 15 quintals. To meet the requirement of fuel-wood fully, project authorities will do plantations in the colony, along the road-side and along the periphery of the reservoir.

CHAPTER - IX

COST OF VARIOUS PROJECT COMPONENTS :

It has been worked out on the basis of the present cost and norms prevailing in State Forest Department. All the works are proposed to be executed departmentally and no contractor profit and overhead charges have been added. However, there will be 10 to 15% annual increase upto the year of execution of the work, which has not been included in the plan. The detail of expenditure for various components has been shown. Abstract of the cost for the project is shown in the Annexures: A

ANNEXURE-A

GENERAL ABSTRACT

CATCHMENT AREA TREATMENT PLAN OF UHL-HYDROELECTRIC POWER PROJECT-III STAGE FOR THE PERIOD 2002-03 TO 2013-14

ABSTRACT OF COST

S.NO.	NAME OF WORK	J/NAGAR RANGE	UHL (BIR) RANGE	TOTAL
		(Rs)	(Rs)	(Rs)
1	Afforestation	11,455,800	0	11,455,800
2	S.S.O	1,651,290	0	1,651,290
3	Consolidation & Demarcation	30,502	0	30,502
4	Forest Protection	155,000	0	155,000
5	Construction of Roads	1,970,000	0	1,970,000
6	construction of buildings	2,500,000	0	2,500,000
7	Soil conservation works	72,411,000	7,826,000	80,237,000
8	Contingency(Agriculture improvement support, Fishery propogation,fuel-wood supply and other JFPM activation)			2,000,000
	GRAND TOTAL	**90,173,592**	**7,826,000**	**99,999,592**
	OR SAY:	90,174,000	7,826,000	**Rs.10 Croros flat**

NOTE: (i) The cost of compensatory plantation/afforestation has not been included in these estimates. A separate scheme/proposal is to be submitted on prescribed proforma in lieu of transfer of forest land for non-forestry purposes.

(ii) The cost of CAT Plan is based on current price index and labour rates which is likely to be changed due to enhancement of labour rates and cost of material.

1)	Filling dry hand packed in wire crates	39.060	42.96	188.50				
	Total:	39.06	42.96	188.50				
	OR SAY		43.00	189.00				

COST OF MATERIAL (F.O.R. WORKSITE)

Boulder Stone 42.50 cumt @ 400/- P/cumt	17,200
Interlink chain 189 Sqm. @ 56/-P/Cum	10,584
Total Material cost (Rs.)	27,784

ABSTRACT OF COST

Labour cost		5,621
Material cost		27,784
	Total:	33,405
	OR SAY: SAY	33,400

Estimate for the construction of SPURS in Wire Crates Length 15.00 Mtrs. Height 2.50 Mtrs.

S.No.	Description of item	Detail of measurement or work	Quantity M³	Rate(Rs) Per cum	Amount (Rs)
1	Excavation in foundation/ trenches in 1/2 earth & 1/2 stone cuttings	15.00x1.25x0.30	5.620	74.77	420.00
2	Boulder/stone filling dry hand packed tightly in the wire crates.	2x15.00x1.25x1.25	46.870	174.50	5,835.00
		Total			6,255.00
		Add increase @ 7.84%			490.00
		Total			6,745.00

Consumption of Material

Item of Work	Qty. (In M³)	Boulder Stones (In M³)	Interlink chain (In M²)				
1) Filling dry hand packed in wire crates	46.870	51.55	226.00				
Total	46.87	51.55	226.00				
OR SAY		51.50	226.00				

COST OF MATERIAL (F.O.R. WORKSITE)

S.No.	Item	Amount
1	[illegible] Stones 51.50 cum @ 400/- P/cum	20,600
2	[illegible] chain 226 Sqm @ 56/- P/Cum	12,656
	Total Material cost (Rs.)	33,256

ABSTRACT OF COST

Labour cost	6,745
Material cost.	33,256
Total:	40,001
OR SAY	40,000

Estimate for the construction of Farm Pond size 20x10x2 Mtrs.

Description of item.	Nos.	L.	W	H/D	Quantity M³	Rate(Rs) Per cumt	Amount.(Rs)
Excavation in foundation/ trenches in 1/2 earth & 1/2 stone cuttings.	1	1/2(18+10)	1/2(8+6)	1.00	119.000		
				TOTAL:	119.000	74.77	8,897.00
Filling in 15 Cm. layer Fr. excavation in the plinth work in embankment Fr. ramming/ watering and Consolidating.							
Long side.	2	1/2(25+18)	1/2(1+3.50)	1.00	96.750		
Short Side.	2	1/2(15+8)	1/2(1+3.50)	1.00	51.750		
				TOTAL:	148.500	36.60	1,083.00
Deduction of Item No.11		148.50-119.00= 29.50 Cumt.					
By rough stone pitching Horizontal							
Bottom of Tank	1	16.00	6.00	0.15	14.40		
Short Side.	2	22.00	1.00	0.15	6.60		
				TOTAL:	21.000	86.30	1,812.00
By rough stone pitching vertical surface:							
Long side slope of tank.	1	1/2(16+20)	2.00	0.15	7.56		
				TOTAL:			850.00
				TOTAL:			12,642.00
				Add increase @ 7.84 %			991.00
				Total Labour Cost (In Rs.)			13,633.00

CONSUMPTION OF MATERIAL

	Qty. (In M³)	Boulder stone/Loose stone
By rough stone pitching Horizontal.	21.00	23.10
By rough stone pitching vertical	7.56	8.31
Total:	28.56	31.41
		Say 31.50

COST OF MATERIAL(FOR WORKSIDE)	
Boulder/Loose stone 31.50 Cumt. @ 400/- P/Cumt	12,600.00
Total Material Cost (In Rs.)	12,600.00

ABSTRACT OF COST

Labour cost	13,633
Material cost	12,600.00
Total:	26,233
Say Rs.	26,000.00
